

Lab 4 – Character Strings

Lab session – The first hour is scheduled for lab session. There are two questions in this lab session. In addition, there is 1 practice question for you to try if you have extra time in the lab.

Note: You do not need to submit your code for this lab.

Lab Questions

1. **(sweepSpace)** Write two versions of a C function that remove all the blank spaces in a string. The first version `sweepSpace1()` will use array notation for processing the string, while the other version `sweepSpace2()` will use pointer notation. The function prototypes are given below:

```
char *sweepSpace1(char *str);
char *sweepSpace2(char *str);
```

A sample program template is given below to test the functions:

```
#include <stdio.h>
#include <string.h>
char *sweepSpace1(char *str);
char *sweepSpace2(char *str);
int main()
{
    char str[80],str2[80], *p;

    printf("Enter the string: \n");
    fgets(str, 80, stdin);
    if (p=strchr(str,'\n')) *p = '\0';
    strcpy(str2,str);
    printf("sweepSpace1(): %s\n", sweepSpace1(str));
    printf("sweepSpace2(): %s\n", sweepSpace2(str2));
    return 0;
}
char *sweepSpace1(char *str)
{
    /* Write your program code here */
}
char *sweepSpace2(char *str)
{
    /* Write your program code here */
}
```

Some sample input and output sessions are given below:

- (1) Test Case 1:
Enter the string:

```
i am a boy
sweepSpace1(): iamaboy
sweepSpace2(): iamaboy
```

(2) Test Case 2:
Enter the string:
anybody
sweepSpace1(): anybody
sweepSpace2(): anybody

2. (**findTarget**) Write a C program that reads and searches character strings. In the program, it contains the function `findTarget()` that searches whether a target name string has been stored in the array of strings. The function prototype is

```
int findTarget(char *target, char nameptr[][80], int size);
```

where *nameptr* is the array of strings, *size* is the number of names stored in the array and *target* is the target string. If the target string is found, the function will return its index location, or -1 if otherwise.

In addition, the program also contains the functions `readNames()` and `printNames()`. The function `readNames()` reads a number of names from the user. The function prototype is given as follows:

```
void readNames(char nameptr[][80], int *size);
```

where *nameptr* is the array of strings to store the input names, and *size* is a pointer parameter which passes the number of names to the caller. The function prototype of `printNames()` which prints the names is given as follows:

```
void printNames(char nameptr[][80], int size);
```

A sample program template is given below for testing the functions:

```
#include <stdio.h>
#include <string.h>
#define SIZE 10
#define INIT_VALUE 999
void printNames(char nameptr[][80], int size);
void readNames(char nameptr[][80], int *size);
int findTarget(char *target, char nameptr[][80], int size);
int main()
{
    char nameptr[SIZE][80], t[40], *p;
    int size, result = INIT_VALUE;
    int choice;

    printf("Select one of the following options: \n");
    printf("1: readNames()\n");
```

```

printf("2: findTarget()\n");
printf("3: printNames()\n");
printf("4: exit()\n");
do {
    printf("Enter your choice: \n");
    scanf("%d", &choice);
    switch (choice) {
        case 1:
            readNames(nameptr, &size);
            break;
        case 2:
            printf("Enter target name: \n");
            scanf("\n");
            fgets(t, 80, stdin);
            if (p=strchr(t,'\n')) *p = '\0';
            result = findTarget(t, nameptr, size);
            printf("findTarget(): %d\n", result);
            break;
        case 3:
            printNames(nameptr, size);
            break;
    }
} while (choice < 4);
return 0;
}
void printNames(char nameptr[][80], int size)
{
    int i;

    for (i=0; i<size; i++)
        printf("%s ", nameptr[i]);
    printf("\n");
}
void readNames(char nameptr[][80], int *size)
{
    /* Write your code here */
}
int findTarget(char *target, char nameptr[][80], int size)
{
    /* Write your code here */
}

```

Some sample input and output sessions are given below:

- (1) Test Case 1:
 Select one of the following options:
 1: readNames()
 2: findTarget()

```
3: printNames()
4: exit()
Enter your choice:
1
Enter size:
4
Enter 4 names:
Peter Paul John Mary
Enter your choice:
2
Enter target name:
John
findTarget(): 2
Enter your choice:
4
```

(2) Test Case 2:

Select one of the following options:

```
1: readNames()()
2: findTarget()
3: printNames()
4: exit()
Enter your choice:
1
Enter size:
5
Enter 5 names:
Peter Paul John Mary Vincent
Enter your choice:
2
Enter target name:
Jane
findTarget(): -1
Enter your choice:
4
```

(3) Test Case 3:

Select one of the following options:

```
1: readNames()()
2: findTarget()
3: printNames()
4: exit()
Enter your choice:
1
Enter size:
5
Enter 5 names:
Peter Paul John Mary Vincent
```

Enter your choice:

3

Peter Paul John Mary Vincent

(4) Test Case 4:

Select one of the following options:

1: readNames()()

2: findTarget()

3: printNames()

4: exit()

Enter your choice:

1

Enter size:

6

Enter 6 names:

Peter Paul John Mary Vincent Joe

Enter your choice:

2

Enter target name:

Joe

findTarget(): 5

Enter your choice:

4

Practice Questions

3. (**palindrome**) Write a function `palindrome()` that reads a character string and determines whether or not it is a palindrome. A palindrome is a sequence of characters that reads the same forwards and backwards. For example, "abba" and "abcba" are palindromes, but "abcd" is not. The function returns 1 if it is palindrome, or 0 if otherwise. The function prototype is given as follows:

```
int palindrome(char *str);
```

A sample program template is given below for testing the function:

```
#include <stdio.h>
#include <string.h>
#define INIT_VALUE -1000
int palindrome(char *str);
int main()
{
    char str[80], *p;
    int result = INIT_VALUE;

    printf("Enter a string: \n");
    fgets(str, 80, stdin);
    if (p=strchr(str, '\n')) *p = '\0';
```

```

    result = palindrome(str);
    if (result == 1)
        printf("palindrome(): A palindrome\n");
    else if (result == 0)
        printf("palindrome(): Not a palindrome\n");
    else
        printf("An error\n");
    return 0;
}
int palindrome(char *str)
{
    /* Write your code here */
}

```

Some test input and output sessions are given below:

- (1) Test Case 1:
 Enter a string:
 abcba
 palindrome(): A palindrome
- (2) Test Case 2:
 Enter a string:
 abba
 palindrome(): A palindrome
- (3) Test Case 3:
 Enter a string:
 abcde
 palindrome(): Not a palindrome
- (4) Test Case 4:
 Enter a string:
 abb a
 palindrome(): Not a palindrome
